EXERCISE FOR LECTURE 3

1. Exercise 1.1 (page 9, Chapter 1 – from today's reading material) It is a very good preparation for today's part of the mini-project!
2. Illustrate boolean retrieval for the query "sales AND july" in the constructed index. What do you get?
3. Design an efficient algorithm (pseudo code) for retrieving "a AND NOT b" (e.g., "home AND NOT new") in an inverted index.

When done, you may start working on the next part of your assignment; the indexer!
